

Hanwha Occupancy Monitoring

Description

Hanwha Occupancy Monitoring is an application that allows the permissible number of people to be set and to trigger an event when the number of occupants is below or above the set capacity. By using the people counting analysis data from the registered cameras and working with entrance boom barrier, entrance monitor screen, and/or other system, it can control the boom barrier or display an entry prohibition message on the monitor screen. This is useful when controlling the number of occupants inside a building by ensuring new visitors wait outside until previous occupants leave. To discuss your needs in detail please contact us so that we may help you define your requirements.

Product Specifications

Weight	0 kg
Brand	Hanwha Vision
